

## Retro-Commissioning (RCx)

Achieve long-term savings and optimize energy performance.

### What is the Retro-Commissioning (RCx) Program?

National Grid's RCx program provides incentives based on the energy you'll save by implementing energy conservation measures (ECMs) identified in your commercial or industrial building.

Our network of Qualified Service Providers (QSPs) will conduct a no-cost energy audit to identify no- and low-cost operational improvements and provide support for the implementation of any improvements you select. This ensures that your equipment operates properly and more efficiently for years to come.

### How do operational energy conservation measures work?

ECMs improve the energy efficiency of major systems by making minor changes to the equipment you already have. ECMs include such things as equipment scheduling, or economizer controls, which reduce energy costs without adversely affecting system operations or occupant comfort.

### Get started today!

#### 1. Choose a Qualified Service Provider

Visit [ngrid.com/rcx](https://ngrid.com/rcx) to identify a Qualified Service Provider who will help you verify eligibility and enroll in the program.

#### 2. Identify ECMs

Your Service Provider performs a facility assessment and identifies no- and low-cost ECMs.

#### 3. Implement Improvements and See Results

Your Service Provider helps you implement improvements, and then verifies energy savings to redeem incentives.
